Implement malloc and free - also PA4

Operations on pointers

`int32_t* a`assume `a` holds  
address `0x...100`

We have done:

lookup  
at index  
assign  
at index  
print`a[i]``a[i] = v``printf("%p\n", a)``a[3]` what address is looked up?
$$0x...160 \quad (0x...100 + 32 * 3)$$

$$\underline{0x...100}$$

$$0x...110$$

↑ 32 bits,  
so 4 bytes  
so  $x100 + 12$

What would we write to set address `0x...114` to 37?`a[5] = 37``uint8_t* b` assume `b` holds address `0x...200``b[3]` what address? `0x...203`What would we write to set `0x...214` to 37? `b[20] = 37``a[3]` vs. `b[3]` the size of the type `int32_t` vs `uint8_t`  
determines the offset/address to use

dereferencing a pointer

`*a`it means look up the value at `a`  
equiv to `a[0]``a + n`  
Pointer arithmetic

means calculate the address at start + byte

 $a + \text{sizeof}(T) * n$  where `a`'s type is `T*` $a + 4 * n$  when `a`'s type is `int32_t*`

$*(a+3)$  means  $a[3]$

$*(a+5)=37$  means  $a[5]=37$
